Foreword

This Japanese Industrial Standard has been established by the Minister of Economy, Trade and Industry, through deliberations at the Japanese Industrial Standards Committee in accordance with the Industrial Standardization Act.

This **JIS** document is protected by the Copyright Act.

Attention is drawn to the possibility that some parts of this Standard may conflict with patent rights, published patent application or utility model rights. The relevant Minister and the Japanese Industrial Standards Committee are not responsible for identifying any of such patent rights, published patent application or utility model rights.

Testing methods for quantitative analysis of fibre mixtures of textiles — Part 3-1 : Instrumental analysis of some animal hair fibres — Using MALDI-TOF MS testing methods for quantitative analysis of fibre mixtures

Introduction

This Japanese Industrial Standard has been prepared based on **ISO 20418-2** : 2018, Edition 1, with some modifications of the technical contents to reflect the local conditions in Japan.

The dotted underlines indicate changes from the corresponding International Standard. A list of modifications with the explanations is given in Annex JD.

The composition labelling of textile products greatly influences characteristics and prices of textile products and is an item that significantly affects all parties concerned in the textile industry from product manufacturers, distributors and sellers, to consumers who purchase textile products. Consequently, it has been a common practice to conduct high level analysis of fibre composition using microscopic techniques and experience of analysts.

In contrast to such conventional methods, this Standard provides a quantitative and qualitative analysis method utilizing advanced instrument that, by establishing analysis methods adapted to domestic fibre products in Japan, can help improve the reliability of high-grade animal hair fibre products for manufacturers, distributors, sellers, and consumers, thereby stimulating the production and sales of such products, and promoting the purchase and expanding markets.

1 Scope

This Standard specifies a qualitative and quantitative procedure to determine the composition of animal hair fibre blends by MALDI-TOF MS. The composition of non-animal hair fibres can be measured by methods described in **JIS L 1030-2**. The results from the procedures described in this Standard and **JIS L 1030-2** can determine the whole composition of textile products containing animal fibres with higher accuracy.

The method covered by this Standard is based on a preliminary identification of animal fibres in an unknown fibre blend according to **JIS L 1030-1**. It is primarily applied to fibre blends of wool, goat hair and yak hair, but may also be applied to rabbit, alpaca, and other animal hair fibres. However, if the textile contains animal hairs belonging to the same species, such as a combination of cashmere and mohair, it is not possible to distinguish the two by using this Standard alone.

NOTE The International Standard corresponding to this Standard and the symbol of degree of correspondence are as follows.

ISO 20418-2 : 2018 *Textiles — Qualitative and quantitative proteomic*
